Nebula

CHANDELIER

Generated: 25/11/2026

Nebula is a contemporary chandelier with a sinuous, elongated shape, built around an S-shaped metal rod intersected by a sequence of artistic glass discs. The movement of the structure captures the eye and makes light part of a fluid composition.

The metal, with its matt gold finish, forms the continuous element along which the glass pieces are arranged. The precision of the rod contrasts with deliberately irregular surface of the glass elements, creating a balance between structure and craftsmanship.

The artistic glass discs are handmade by master glassmakers in the Venice area. The irregularities inherent in the process make each element different, responding to light in subtly different ways.

LED strips integrated into the metal structure illuminate the glass elements directly. Reflections, transparency and surface variations become more apparent, following the sinuous course of the chandelier.

Its horizontal proportions make Nebula particularly suited to the dining area, where the light can extend above the table while preserving the continuity of the space.

Nebula expresses HESSENTIA's ability to bring together Venetian artistic glass, metal and integrated lighting. In this composition, the precision of the structure supports the lively irregularity of handmade elements.
