Nova

WALL LAMP

Nova is a wall lamp with a dual identity: during the day, it appears as a compact reflective element, while, when switched on, it becomes an atmospheric lamp that projects a beam of light downwards.

The structure consists of a double metal ring, where the overlapping elements create a slim, vertical profile that evokes the geometric distinctive details of Nova collection.

The metal rings alternate between shiny and matt finishes: this contrast changes the way light is reflected during the day and reveals different parts of the structure.

Some sections are hand-decorated to create a sculptural effect. Handcraftsmanship introduces subtle variations into the precision of the ring, making the surface a decorative detail to appreciate even when the lamp is switched off.

In the evening, the downward beam changes the relationship with the wall and gives the element a more intimate presence. Used as a pair, Nova can create a vertical rhythm and greater continuity within the composition.

Nova wall lamp balances reflection and illumination, shiny and matt surfaces, geometric precision and handcraftsmanship, extending the design language of the wider HESSENTIA collection into lighting.
