Richmond

CHANDELIER

Generated: 03/11/2026

Richmond is a chandelier with a radial composition, built around a central metal sphere from which several elements extend. Artistic glass petals sit at the ends of the rays, transforming the structure into a luminous presence that spreads in every direction.

The petals are handcrafted by master glassmakers in the Venice area. Their arrangement around the metal core introduces an organic rhythm into a geometric, symmetrical composition.

An artisanal technique creates small bubbles within the glass. These inclusions become part of its surface and influence the passage of light, creating reflections and variations that give the material visual depth.

When the light meets the glass, the bubbles capture reflections, making each petal an active part of the overall lighting effect.

The glass is available in light gold and metallic blue shades. Colour changes the character of the composition while preserving the radial principle that defines the product's identity.

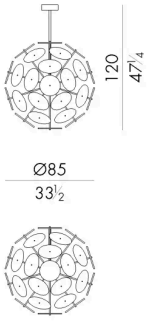

Richmond brings together a metal structure, Venetian artistic glass and light in a composition that expands from the centre into the surrounding space, like a luminous form continuously unfolding.
