

Table lamp Saturn has a refined and contemporary look where a metal support is enriched by a "pulegoso" glass disk with a great thickness, obtained thanks to the casting-in-plates technique. This working process dates back to the beginning of Twentieth Century and it helps to obtain a glass full of little bubbles whose result depends on the skills of the artisans that create unique pieces. The designer took inspiration from this technique because it can exalt the extraordinary beauty of the glass crossed by the light rays. The intensity of the light can be adjusted thanks to a touch system placed on the metal insert above the glass disk.
